Total Commenal Balance: The total commensal abundance is a sum-total of the reported commensal bacteria compared to a healthy cohort. Low levels of commensal bacteria are often observed after antimicrobial therapy, or in diets lacking fiber and/or prebiotic-rich foods and may indicate the need for microbiome support. Conversely, higher total commensal abundance may indicate potential bacteria overgrowth or probiotic supplementation.

Dysbiosis Patterns

Dysbiosis Patterns: Genova's data analysis has led to the development of unique dysbiosis patterns, related to key physiologic disruptions, such as immunosuppresion and inflammation. These patterns may represent dysbiotic changes that could pose clinical significance. Please see Genova's published literature for more details: https://rdcu.be/bRhzv

Page 2

Zone 1: The commensal profile in this zone does not align with profiles associated with intestinal inflammation or immunosuppression. If inflammatory biomarkers are present, other causes need to be excluded, such as infection, food allergy, or more serious pathology.

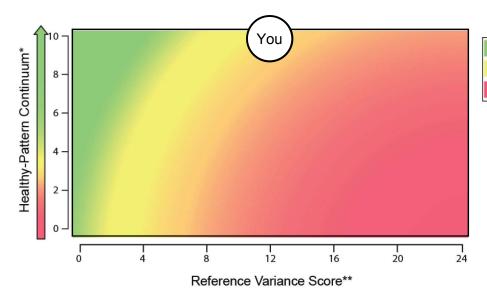

Zone 2: This pattern of bacteria is associated with impaired intestinal barrier function (low fecal slgA and EPX). Patients in this zone have higher rates of opportunistic infections (e.g. *Blastocystis spp. & Dientamoeba fragilis*) as well as fecal fat malabsorption. Commensal abundance is higher in this group suggesting potential bacterial overgrowth.

Zone 3: Patients in this zone may have more inflammation compared to those in zone 4. However, commensal abundance is usually higher making use of antimicrobial therapy relatively safer. Patients in this zone may have higher rates of pathogenic infections.

Zone 4: This commensal profile is associated with increased intestinal inflammation. IBD patients are more likely to have this pattern of bacteria. Commensal abundance is lower in this zone; therefore, antibiotic use for GI potential pathogens should be used with caution. In addition to standard treatment for intestinal inflammation, modulation of the commensal gut profile is encouraged.

Commensal Microbiome Analysis

Commensal Balance

Balanced	Represents 95% of healthy individuals	
Borderline	Represents 5% of healthy individuals	
Imbalanced	Represents 60% of unhealthy individuals	

*A progressive ranking scale based on a Genova proprietary algorithm that differentiates healthy and unhealthy commensal patterns.

**The total number of Commensal Bacteria (PCR) that are out of reference ranges for this individual.

Relative Commensal Abundance

	-50)% -2	+2 Cohort	5%
Bacteroidetes Phylum				Increase in <i>Bacteroides spp</i> . and <i>Odoribacter spp</i> . seen in animal-based
				diets; <i>Prevotella</i> increased with plant-based diet Contains many butyrate-producers; most species responsive to
Firmicutes Phylum				plant-based diets; Faecalibacterium spp. is anti-inflammatory
Actinobacteria Phylum				Bifidobacterium is increased with plant-based diets; Collinsella
				may be proinflammatory, and is elevated with a Western-diet
Proteobacteria Phylum				Some species may be proinflammatory; <i>E. coli</i> consumes simple
				sugars and is lower in individuals on plant-based diets
				Methanobrevibacter smithii is associated with methane
Euryarchaeota Phylum				production and with diets high in carbohydrates
				Certain Fusobacterium spp. may be proinflammatory and
Fusobacteria Phylum				increased on low fiber, high fat diets
Vermuserrienshie Dhuluns				Akkermansia spp. is involved in gut membrane integrity and
Verrucomicrobia Phylum				may be increased with polyphenols and prebiotics

Relative Abundance: The relative abundance compares the quantity of each of 7 major bacterial phyla to a healthy cohort. This can indicate broader variances in the patient's gut microbiome profile. Certain interventions may promote or limit individual phyla when clinically appropriate. Please refer to Genova's Stool Testing Support Guide for more information on modulation of commensal bacteria through diet & nutrient interventions. ***Roughly 75% of the healthy cohort had below detectable levels of *Methanobrevibacter smithii.*

Firmicutes/Bacteroidetes Ratio Firmicutes/Bacteroidetes (F/B Ratio)	11 L	▶ + + + + +	12-620

The gray-shaded portion of a quintile reporting bar represents the proportion of the reference population with results below detection limit.

Commensal results and reference range values are displayed in a computer version of scientific notation, where the capital letter "E" indicates the exponent value (e.g., 7.3E6 equates to 7.3×10^6 or 7.300,000).

The Firmicutes/Bacteroidetes ratio (F/B Ratio) is estimated by utilizing the lowest and highest values of the reference range for individual organisms when patient results are reported as <DL or >UL.

Ρ

Pathogen

Gastrointestinal Microbiome (Culture)**

Human microflora is influenced by environmental factors and the competitive ecosystem of the organisms in the GI tract. Pathogenic significance should be based upon clinical symptoms.

Microbiology Legend

PP

Potential

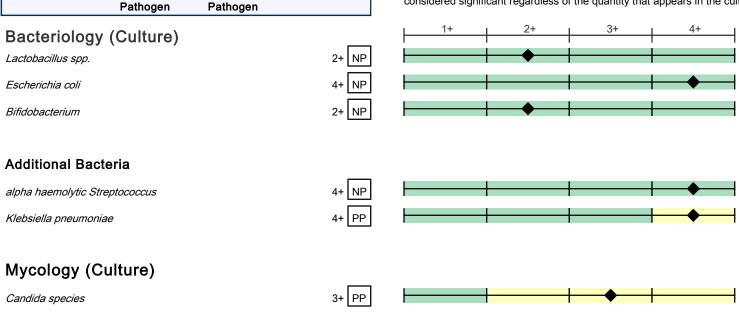

NP

Non-

Additional Bacteria

Non-Pathogen: Organisms that fall under this category are those that constitute normal, commensal flora, or have not been recognized as etiological agents of disease.

Potential Pathogen: Organisms that fall under this category are considered potential or opportunistic pathogens when present in heavy growth. **Pathogen:** The organisms that fall under this category have a well-recognized mechanism of pathogenicity in clinical literature and are considered significant regardless of the quantity that appears in the culture.

KOH Preparation for Yeast**

Methodology: Potassium Hydroxide (KOH) Preparation for Yeast

Potassium Hydroxide (KOH) Preparation for Yeast

These yeast usually represent the organisms isolated by culture. In the presence of a negative yeast culture, microscopic yeast may reflect organisms not viable enough to grow in culture. The presence of yeast on KOH prep should be correlated with the patient's symptoms. However, moderate to many yeast suggests yeast overgrowth.

Result

KOH Preparation, stool

Few Yeast Present

The result is reported as the amount of yeast seen microscopically: Rare: 1-2 per slide Few: 2-5 per high power field (HPF) Moderate: 5-10 per HPF Many: >10 per HPF

Recognizes Properdin as a Potential Second Member of the Zonulin Family. Front Endocrinol. 2018;9:22.

Macroscopic/Direct Exam for Parasites **

Methodology: Macroscopic Evaluation

No human parasite detected in sample.

Add-on Testing								
Methodology: EIA	Result	Expected Value	HpSA (<i>Helicobacter pylori</i> stool antigen)					
HpSA - <i>H. pylori</i>	Negative	Negative	Helicobacter pylori is a bacterium which causes peptic ulcer disease and plays a role in the development of					
<i>Campylobacter</i> spp.◆**	Negative	Negative	gastric cancer. Direct stool testing of the antigen (HpSA) is highly accurate and is appropriate for diagnosis and					
Clostridium difficile ◆**	Negative	Negative	follow-up of infection.					
Shiga toxin <i>E. coli∙*</i> *	Negative	Negative						
Fecal Lactoferrin +**	Negative	Negative						

Clostridium difficile

Clostridium difficile is an anaerobic, spore-forming gram-positive bacterium. After a disturbance of the gut flora (usually with antibiotics), colonization with *Clostridium difficile* can take place. *Clostridium difficile* infection is much more common than once thought.

Shiga toxin E. coli

Shiga toxin-producing *Escherichia coli* (STEC) is a group of bacterial strains that have been identified as worldwide causes of serious human gastrointestinal disease. The subgroup enterohemorrhagic *E. coli* includes over 100 different serotypes, with 0157:H7 being the most significant, as it occurs in over 80% of all cases. Contaminated food continues to be the principal vehicle for transmission; foods associated with outbreaks include alfalfa sprouts, fresh produce, beef, and unpasteurized juices.

** Indicates testing performed by Genova Diagnostics, Inc. 63 Zillicoa St., Asheville, NC 28801-0174

Tests were developed and their performance characteristics determined by Genova Diagnostics. Unless otherwise noted with •, the assays have not been cleared by the U.S. Food and Drug Administration.

Methodology: Vitek 2® System Microbial Antibiotic susceptibility, Manual Minimum Inhibition Concentration

Mycology Sensitivity

Azole Antifungals

/ Zolo / Intilangulo				_			
Candida species	R	1	S-DD		S		NI
Fluconazole					0.5		
Voriconazole					<=0.008		
Nystatin	=50						
Natural Agents							
Candida species		N				I	HIGH INHIBITION
Berberine							
Caprylic Acid							
Garlic							
Undecylenic Acid							
Plant tannins							
Uva-Ursi							

Prescriptive Agents:

The R (Resistant) category implies isolate is not inhibited by obtainable levels of pharmaceutical agent.

The I (Intermediate) category includes isolates for which the minimum inhibition concentration (MIC) values usually approach obtainable pharmaceutical agent levels and for which response rates may be lower than for susceptible isolates.

The S-DD (Susceptible-Dose Dependent) category implies clinical efficacy when higher than normal dosage of a drug can be used and maximal concentration achieved.

The S (Susceptible) column implies that isolates are inhibited by the usually achievable concentrations of the pharmaceutical agent.

NI (No Interpretive guidelines established) category is used for organisms that currently do not have established guidelines for MIC interpretation.

Refer to published pharmaceutical guidelines for appropriate dosage therapy.

Nystatin and Natural Agents:

Results for Nystatin are being reported with natural antifungals in this category in accordance with laboratory guidelines for reporting sensitivities. In this assay, inhibition is defined as the reduction level on organism growth as a direct result of inhibition by a natural substance. The level of inhibition is an indicator of how effective the substance was at limiting the growth of an organism in an in vitro environment. High inhibition indicates a greater ability by the substance to limit growth, while Low Inhibition a lesser ability to limit growth. The designated natural products should be considered investigational in nature and not be viewed as standard clinical treatment substances.

Methodology: Vitek 2® System Microbial Antibiotic susceptibility, Manual Minimum Inhibition Concentration

Bacteria Sensitivity

Prescriptive Agents

			_				
Klebsiella pneumoniae	R	1		S-DD	S		NI
Ampicillin	R						
Amox./Clavulanic Acid					S		
Cephalothin					S		
Ciprofloxacin					S		
Tetracycline					S		
Trimethoprim/Sulfa					S		
Natural Agents							
Klebsiella pneumoniae						н	IGH INHIBITIO

Klebsiella pneumoniae	LOW INHIBITION	HIGH INHIBITION
Berberine		
Oregano		
Plant Tannins		
Uva-Ursi		

Prescriptive Agents:

The R (Resistant) category implies isolate is not inhibited by obtainable levels of pharmaceutical agent.

The I (Intermediate) category includes isolates for which the minimum inhibition concentration (MIC) values usually approach obtainable pharmaceutical agent levels and for which response rates may be lower than for susceptible isolates.

The S-DD (Susceptible-Dose Dependent) category implies clinical efficacy when higher than normal dosage of a drug can be used and maximal concentration achieved.

The S (Susceptible) column implies that isolates are inhibited by the usually achievable concentrations of the pharmaceutical agent.

NI (No Interpretive guidelines established) category is used for organisms that currently do not have established guidelines for MIC interpretation.

Refer to published pharmaceutical guidelines for appropriate dosage therapy.

Natural Agents:

In this assay, inhibition is defined as the reduction level on organism growth as a direct result of inhibition by a substance. The level of inhibition is an indicator of how effective the substance was at limiting the growth of an organism in an in vitro environment. High inhibition indicates a greater ability by the substance to limit growth, while Low Inhibition a lesser ability to limit growth. The designated natural products should be considered investigational in nature and not be viewed as standard clinical treatment substances.
